EDUCATION

University of Alberta **May 2027**
Bachelor of Science, Computer Science, Minor in Mathematics *Edmonton, AB*

- **Relevant Coursework:** Software Engineering, Data Structures and Algorithms, Database Management, Computer Architecture I, II, Machine Learning, Operating Systems, Artificial Intelligence, Numerical Analysis, Calculus I, II, III, IV, ODE.

WORK EXPERIENCE

AlbertaSAT **June 2026 – Present**
Software Engineer *Edmonton, AB*

- Developing flight software in **RUST** for the **EX-ALTA3** satellites on board computer as part of a **30+** person team, following code review and testing requirements for mission-critical reliability constraints.
- Implemented Display formatting for Digital Fluxgate Magnetometer (**DFGM**) telemetry, making incoming data human readable for ground station operators.
- Implemented fault handling policy for non-critical subsystems (**ADCS**, **DFGM)** that powers off through **EPS** commands, after failed health ping, keeping system recovery under operator control.

PROJECTS

OS 1 | *C, QEMU* **In Progress**

- Building a bare-metal **x86_64 OS** kernel with a custom **IDT** for **CPU** exceptions and hardware interrupt handling, multilevel paging for virtual memory, and a heap allocator supporting bump, linked-list, and fixed-size block strategies

Distributed System Monitor | *C++* ***January 2026 – February 2026***

- Built a distributed monitoring system across two programs, distpsnotify and remoteagent, coordinating **real-time data collection** over **TCP/IP** sockets from multiple remote machines simultaneously
- Designed and implemented a custom client-server command protocol (**EXECUTE/QUIT**, **START/STOP** delimiters) for structured, ordered data exchange across persistent socket connections
- Engineered dynamic **memory management** for an arbitrary number of remote agents using heap allocations, verifying **zero** memory leaks across all code paths using **Clang** leak tools on **macOS**

RISC-V to WASM Converter | *RISC-V (RV32I)* ***September 2025 – October 2025***

- Designed and implemented support for R-Type, I-Type, and Branch instructions, including arithmetic, logic, shifts, and conditional control flow
- Built a signed **LEB128** encoder from scratch to extract immediate operands and convert them to WASM bytecode

Sulfur-Events Lottery Application | *Java, Firebase* ***September 2025 – December 2025***

- Developed a full-stack Android application with **4+** group members using **Java**, **Android Studio**, and **Firebase** for managing and tracking event/user **data**
- Implemented **QR** code generation and scanning features, including storing and extracting embedded **geolocation** data to display and update event/user locations
- Utilized **Firebase Cloud Firestore** for structured cloud data storage, **querying**, and multi-user data consistency

3D Engine CPU Rasterizer | *C, SDL2* ***January 2025 – May 2025***

- Engineered a fully interactive 3D engine in **C**, leveraging **SDL2** for graphics abstractions and input handling, with backface culling, near-plane clipping, dynamic camera transformations, and basic lighting
- Designed multiple real-time rendering modes (Wireframe, Vertex-Highlighted, Solid-fill, Textured) with keyboard-driven mode switching and **6** degrees of camera freedom
- Architected the project into modular components (Lighting, Geometry, Mesh, Culling, Camera, etc.), enabling extensibility and low-level control over the render pipeline

TECHNICAL SKILLS

Languages: Python, C, C++, Java, SQL, Rust, RISC-V, HTML/CSS, SPSS
Libraries/Frameworks: PostgreSQL, MongoDB, Firebase, Supabase, Spring Boot, UML, Valgrind, Clang, Makefile, CMake, QEMU
Developer Tools: Git, Docker, Android Studio
